

**AMENDMENTS TO THE SPECIFICATION**

Please replace the original paragraph number [0040] with the following paragraph (with changes marked), which corrects inconsistencies in the reference to the Figures and a typographical error:

[0040] The stimuli are generated by a first computer 10 (Fig. 402) and presented by means of any suitable visual display apparatus 12. The visual display apparatus 12 may comprise any of a variety of well known display devices, including cathode ray tubes, LCD displays, video projectors etc. It is preferred that the display area is relatively large in order to allow a reasonable distance between the test subject and the display. It is particularly preferred that the display 12 comprises a plasma type monitor, which provides a large display area and instantaneous screen updates (as compared with raster-scan type displays).
